Can you help me figure out what it is that i need to do:
Week 7 - Mid-Term Project Kickoff
This week is all about setting up and planning your mid-term project. You'll choose your app idea, deploy a starter project, and write a feature plan — so you can spend all of Week 8 actually building.

Learning Objectives
Choose a mid-term project and plan your features, data model, and tech stack
Set up and deploy your project scaffold so you can start building immediately in Week 8
Write a project plan with clear features, deliverables, and scope
Readings
Complete before starting the exercise and quiz (~12 minutes):

Planning Your Project (12 min) — How to define an MVP, plan features in phases, and manage scope so your mid-term project stays achievable.
Assignments
All due Monday, March 9 at 11:59 PM

Assignment	Points	Details
Week 7 Knowledge Check	15	10 questions, 20 min, 2 attempts, open book
Week 7 Exercise: Mid-Term Project Kickoff	30	Set up and deploy your mid-term project: custom landing page, GitHub repo, README with feature plan, AI transcript.
Week 6-7 Discussion Replies	8	Reply to 2 classmates in the Week 6-7 discussion

Getting Started
The Week 8 Mid-Term Project assignment has full details on tiers, requirements, and rubrics. Read it before you start — this week's exercise is the setup work for that project.

Your checklist for this week:

Choose your project idea and tier (Base or Complete)
Create a web project and push to a public GitHub repo
Deploy to Netlify, Vercel, or GitHub Pages
Customize the landing page (project name, description — not a framework default)
Write a README with your project description, planned features, and tech stack
Export your AI transcript from the setup process
By the end of this week you should have a deployed app, a clear plan, and your AI transcript. That's it — you're ready to build in Week 8.

Next week: Week 8 — Mid-Term Project. Build and deploy your application.

Yes — this assignment is mostly **planning and setup**, not building the full app yet. Think of it as **preparing everything so next week you can just start coding**. I'll break down **exactly what you need to do step-by-step**.

Week 7 – What You Actually Need to Do

You have **3 graded things**:

1. **Knowledge Check (quiz)** – 10 questions
2. **Exercise: Mid-Term Project Kickoff** – the main task
3. **Discussion Replies** – reply to 2 classmates

The confusing part is **the Exercise**, so let's focus on that.

The Week 7 Exercise (Main Assignment)

Your professor wants you to **prepare your mid-term project**, not build it yet.

You need to turn in **5 things**:

1️⃣ Choose Your Project Idea

Pick what kind of **web app** you want to build.

Example ideas:

- To-do list
- Habit tracker
- Workout tracker
- Event planner
- Budget tracker
- Study planner

Since you've built:

- React apps
- React Native apps
- TODO apps

A **task / habit tracker** would be perfect and simple.

Example:

Project Name:

`FocusTrack`

Description:

A web app that helps students track tasks and study goals.

2️⃣ Create a Project + Push to GitHub

You need a **public GitHub repository**.

Steps:

1. Go to **GitHub**
2. Click **New Repository**
3. Name it something like:

```
midterm-project
```

or

```
focus-tracker-app
```

Make it **Public**.

3️⃣ Create a Basic Web Project

Your professor just wants a **starter project**.

Simplest option:

Create:

```
index.html
style.css
script.js
```

Example **index.html**:

```html
<!DOCTYPE html>
<html>
<head>
  <title>FocusTrack</title>
  <link rel="stylesheet" href="style.css">
</head>
<body>

<h1>FocusTrack</h1>
<p>A simple app to track tasks and study goals.</p>

</body>
</html>
```

What is this?

This is just a **landing page**.

Important:

Your professor said it **cannot be a default template**.

So you must change the title and description.

4️⃣ Deploy Your Website

You must publish it online using one of these:

- Netlify
- Vercel
- GitHub Pages

The easiest is **GitHub Pages**.

Steps:

1. Go to your repo
2. Click **Settings**
3. Click **Pages**
4. Select **main branch**
5. Save

You will get a link like:

```
https://yourname.github.io/focus-tracker
```

That link is your **deployed app**.

5️⃣ Write a README File

In GitHub create **README.md**

Example structure:

```
# FocusTrack

## Project Description
FocusTrack is a web application that helps students organize tasks, track study g
```

```
## Planned Features

MVP Features:
- Add tasks
- Mark tasks complete
- Delete tasks
- Display task list

Future Features:
- Task categories
- Progress tracker
- Study timer

## Tech Stack
HTML
CSS
JavaScript
GitHub Pages (deployment)

## Author
Your Name
```

6️⃣ Export Your AI Transcript

Your professor wants proof you **used AI to help plan**.

This likely means:

- Export the conversation where you planned the project
- Submit it as a **PDF or text file**

If you're using **ChatGPT**, you can copy the conversation or export it.

This conversation could actually count.

What You Submit

Your submission will probably include:

1. **GitHub repository link**
2. **Live deployed website link**

3. **README file**
4. **AI transcript**

What Your Website Might Look Like (Example)

```
FocusTrack

Stay organized and track your daily study tasks.

This application helps students manage tasks,
stay focused, and track productivity.

Coming in Week 8:
• Task management
• Progress tracking
• Study timer
```

Simple is fine.

What Happens in Week 8

Next week you will **actually build the app features**, like:

- Add tasks
- Mark tasks complete
- Delete tasks
- Store data

If You Want, I Can Also Help You

I can help you:

✅ Pick the **best project idea for your skills**
✅ Write the **README**
✅ Create the **starter HTML page**
✅ Walk you through **deploying to GitHub Pages**
✅ Plan **Week 8 features so the project is easy**

If you want, tell me:

1️⃣ What class is this for? (Web dev? Full stack?)
2️⃣ Are you allowed to use **React** or just **HTML/CSS/JS**?

Then I can help you design a **project that will get an A but still be easy.**

Okay so lets get this started, lets review this assignment and the rubric to make sure we follow all of the guideliness to ace this project: Week 7 Exercise: Mid-Term Project Kickoff
Due: Monday, March 9 at 11:59 PM Points: 30

Overview
This exercise grades the setup work you need to do before you start building your mid-term project in Week 8. By the end of this exercise, you'll have a deployed starter app, a clear plan, and real content ready to go — so you can spend all of Week 8 actually building features.

Everything you submit here carries directly into your mid-term project. This isn't busywork — it's a head start.

What You'll Do
Create a web project for your mid-term app
Deploy it (Netlify, Vercel, or GitHub Pages)
Customize the landing page with your project name and description
Write a README with your project plan
Export your AI transcript from the setup process
See the Week 7 page for more guidance.

Grading Rubric
Criterion Points Full Credit Partial Credit No Credit
Deployed App 8 Custom landing page at your URL — project name, description, and basic styling (not a framework default) URL works but still shows a default

starter page or has errors No URL provided or page doesn't load
GitHub Repository 8 Public repo with clear project structure, .gitignore, and meaningful commit messages Repo exists but messy structure or missing key files No repo or repo is inaccessible
README & Feature Plan 8 README includes: project description, 4-5 planned features, and tech stack README exists but missing 2+ sections No README or template-only
Canvas Submission 6 All items submitted: both URLs, project description, planned features, screenshot, and AI transcript Missing 1-2 items Missing most items
Total: 30 points

What to Submit on Canvas
Submit the following as a text entry with file uploads:

Deployed URL — your app running on Netlify, Vercel, or GitHub Pages
GitHub repo URL — must be public so I can review it
Project description — 2-3 sentences explaining what your app does
4-5 planned features — listed out (these should match your README)
Screenshot of your deployed app showing the custom landing page
AI transcript — export from whatever AI tool you used (Claude Code: /export, Cursor: copy chat files, Windsurf: export from sidebar)
What Should Be in Your Repo
A web project with a customized landing page (not a default starter screen)
README.md with your project plan (description, features, tech stack)
.gitignore that excludes node_modules/ and any files that shouldn't be committed
Tips
Deploy early, deploy often. Set up Netlify or Vercel before you start customizing. That way you know deployment

works and you can check your live site as you go.

Your landing page doesn't need to be fancy. Project name, a sentence about what it does, and some basic styling that isn't the default starter. You'll build the real UI in Week 8.

Don't overthink the feature list. 4-5 concrete features is plenty. You can always add more during Week 8 if you finish early.

Next week: You'll use everything you set up here to build your mid-term project. Students who complete this exercise thoroughly will have a significant head start.

Great — this is the **right way to approach it**. If we follow the rubric exactly, you can basically **guarantee the full 30 points**. Let's break it down **like a checklist aligned to the rubric** so nothing gets missed.

Step 1: Understand Exactly How You Get the 30 Points

The rubric has **4 grading sections**.

Section	Points	What Professor Wants
Deployed App	8	Website online with a **custom landing page**
GitHub Repo	8	Clean **public repo with project structure**
README & Feature Plan	8	README with description, features, tech stack
Canvas Submission	6	Submit URLs, screenshot, description, features, AI transcript

If we complete **each requirement**, you will get full credit.

Step 2: Choose a Project Idea (First Thing)

Before creating anything, we need your **app idea**.

Your professor wants something you will **finish in Week 8**, so it should be simple but functional.

Good options based on your experience:

Option 1 — Study Planner

Name: StudyFlow

Students can:

- add assignments
- track due dates
- mark tasks complete

Option 2 — Habit Tracker

Name: HabitHero

Users can:

- create habits
- mark them complete daily
- see streak progress

Option 3 — Workout Tracker

Name: FitLog

Users can:

- track exercises
- record reps and time
- view workout history

✅ **Recommendation:** Study Planner (simplest and very useful)

Example:

App Name

```
StudyFlow
```

Description

```
StudyFlow is a simple web application that helps students organize assignments an
```

Step 3: Create the GitHub Repository (8 pts)

Go to **GitHub**

Create a repo like:

```
studyflow-app
```

Make sure it is **Public**.

Your repo should look like this:

```
studyflow-app
│
├── index.html
├── style.css
├── script.js
├── README.md
└── .gitignore
```

That satisfies the **project structure requirement**.

Step 4: Create the Landing Page (8 pts)

Your professor said:

NOT a default starter page

So it must include:

- Project name
- Description
- Some styling

Example **index.html**

```html
<!DOCTYPE html>
<html>
<head>
  <title>StudyFlow</title>
  <link rel="stylesheet" href="style.css">
</head>

<body>

<h1>StudyFlow</h1>

<p>
StudyFlow helps students organize assignments and stay productive.
Add tasks, track progress, and manage your study goals.
</p>

</body>
</html>
```

What is this?

Example **style.css**

```css
body {
  font-family: Arial;
  text-align: center;
  background-color: #f4f6f8;
  padding-top: 80px;
}

h1 {
  color: #2c3e50;
```

```
}

p {
  font-size: 18px;
}
```

That is already **enough to earn the landing page points**.

Step 5: Deploy the Website (8 pts)

Use **GitHub Pages** (easiest).

Steps:

1. Push your files to GitHub
2. Go to **Repo Settings**
3. Click **Pages**
4. Select **main branch**
5. Save

You will get a live URL like:

```
https://yourusername.github.io/studyflow-app
```

That is your **Deployed URL**.

Step 6: Write the README (8 pts)

Create **README.md**

Example:

```
# StudyFlow

## Project Description
StudyFlow is a web application that helps students organize assignments and track

## Planned Features

1. Add new tasks
```

```
2. Mark tasks as completed
3. Delete tasks
4. Display all tasks in a list
5. Save tasks using local storage

## Tech Stack

HTML
CSS
JavaScript
GitHub Pages for deployment
```

That meets **all rubric requirements**.

Step 7: Screenshot (Canvas Requirement)

After deploying:

1. Open your live site
2. Take a screenshot
3. Make sure it shows:
    - project name
    - description
    - styling

Step 8: AI Transcript

The assignment says export the AI conversation.

Since you're using **ChatGPT**, you can:

- Copy the conversation
- Save as **PDF**
- Upload it

This conversation can be part of the transcript.

Step 9: What You Submit to Canvas (6 pts)

Your submission should include:

1️⃣ Deployed URL

Example:

```
https://username.github.io/studyflow-app
```

2️⃣ GitHub Repo

Example:

```
https://github.com/username/studyflow-app
```

3️⃣ Project Description (2–3 sentences)

Example:

```
StudyFlow is a web application designed to help students organize assignments and
```

4️⃣ Planned Features

```
• Add tasks
• Mark tasks complete
• Delete tasks
• Display task list
• Save tasks using local storage
```

5️⃣ Screenshot

Image of your deployed site.

6️⃣ AI Transcript

Export this conversation.

How to Get an Easy 30/30

Do these **4 things perfectly**:

✔️ Custom landing page
✔️ Clean GitHub repo
✔️ Good README
✔️ Submit all Canvas items

Next Step (Important)

Before we create anything, we should **choose the final project idea**.

So tell me:

1️⃣ Do you want the **Study Planner app**?
2️⃣ Or do you want something more unique like **Habit Tracker or Workout Tracker**?

Once you choose, I can also help you:

- Write the **perfect README**
- Create a **nice landing page**
- Plan **Week 8 features so the project is easy**
- Help you **deploy step-by-step**.

Okay, I have decided I want to do a "Movie or Book Tracker — Browse a collection of movies or books, save favorites to localStorage, mark as watched/read, rate and review, filter by genre or status." I want to aim at a

complete tier because I want full points possible so if we have to come up with 6-8 total features, we will.

Excellent choice. A **Movie/Book Tracker** is perfect for this assignment because it's **simple enough to finish but still impressive**, especially if you're aiming for the **Complete Tier (6–8 features)**.

Let's structure this so it **fits the rubric perfectly** and also prepares you for **Week 8 development**.

---

1. Final Project Concept

Project Name (choose one)

You should use something **clean and memorable**:

Option A (recommended)
StoryVault

Other options:

- ScreenShelf
- ReelReads
- WatchList
- Book & Reel Tracker

I recommend **StoryVault** because it works for **both movies and books**.

---

2. Project Description (For Canvas + README)

Use something like this:

Project Description

StoryVault is a web application that allows users to browse and track movies or books they want to watch or read. Users can save favorites, mark items as watched or read, rate and

review them, and filter their collection by genre or completion status. The goal is to help users organize and keep track of their entertainment in one simple interface.

This satisfies the **2–3 sentence requirement**.

---

3. Planned Features (Complete Tier)

You said **6–8 features**, so let's choose **7 strong ones**.

Core Features (MVP)

1️⃣ Browse Collection

Users can browse a predefined list of movies or books displayed on the page.

2️⃣ Save Favorites

Users can save items to a personal favorites list.

3️⃣ Mark as Watched/Read

Users can mark items as completed.

4️⃣ Rating System

Users can rate movies/books (example: 1–5 stars).

5️⃣ Write Reviews

Users can add a short review for each item.

Advanced Features

6️⃣ Filter by Genre

Users can filter items (Action, Drama, Fantasy, etc.).

7️⃣ Filter by Status

Users can filter by:

- Watched/Read
- Not Watched/Unread
- Favorites

This is **perfect for the Complete Tier**.

---

4. Tech Stack

Your README should list something like this:

Tech Stack

Frontend:

- HTML
- CSS
- JavaScript

Storage:

- Browser localStorage

Deployment:

- **GitHub Pages**

Version Control:

- **GitHub**

---

5. Recommended Project Structure

Your repo should look like this:

```
storyvault-app
│
├── index.html
├── style.css
├── script.js
│
├── data
│   └── movies.js
│
├── assets
│   └── images
│
```

```
├── README.md
└── .gitignore
```

This will look **clean and professional** for the rubric.

---

6. Landing Page Content (Week 7 Requirement)

Remember: the rubric says **custom landing page**.

Example:

index.html content

```html
<!DOCTYPE html>
<html>
<head>
<title>StoryVault</title>
<link rel="stylesheet" href="style.css">
</head>

<body>

<h1>StoryVault</h1>

<p>
Track the movies you watch and the books you read in one place.
Save favorites, rate your experiences, and keep track of what you've finished.
</p>

</body>
</html>
```

What is this?

---

style.css example

```css
body {
  font-family: Arial, sans-serif;
```

```
  background-color: #f5f7fa;
  text-align: center;
  padding-top: 100px;
}

h1 {
  font-size: 48px;
  color: #2c3e50;
}

p {
  font-size: 20px;
  max-width: 600px;
  margin: auto;
}
```

This already satisfies the “**basic styling**” **requirement**.

---

7. README Template (You Will Need This)

Use this for **README.md**.

```
# StoryVault

## Project Description
StoryVault is a web application that helps users track movies or books they want

## Planned Features

1. Browse a collection of movies or books
2. Save favorites
3. Mark items as watched or read
4. Rate items using a 1–5 rating system
5. Write short reviews
6. Filter items by genre
7. Filter items by completion status

## Tech Stack

HTML
CSS
JavaScript
localStorage
GitHub Pages for deployment
```

```
## Author
Your Name
```

This **fully satisfies the README rubric section**.

---

8. What You Will Submit to Canvas

Make sure you include:

1️⃣ Deployed URL

Your live website from **GitHub Pages**

Example:

```
https://yourusername.github.io/storyvault
```

2️⃣ GitHub Repo URL

From **GitHub**

Example:

```
https://github.com/yourusername/storyvault
```

3️⃣ Project Description

Use the description we wrote above.

4️⃣ 6–7 Planned Features

List them clearly.

5️⃣ Screenshot

Screenshot of the **live deployed landing page**.

6️⃣ AI Transcript

Export this conversation.

---

9. Week 8 (What You'll Build)

Next week you'll implement:

- movie/book cards
- favorite button
- watched/read toggle
- rating stars
- review input
- filters
- localStorage

Totally doable in **a few hours**.

---

10. One Thing That Could Make Your Project Stand Out

Instead of just text, the landing page could say:

```
StoryVault

Your personal tracker for movies and books.

Browse titles, save favorites, rate your experiences,
and keep track of what you've watched or read.
```

Clean and professional.

Next Step (Important)

Before we start creating files, we should finalize **2 small decisions**:

1️⃣ Do you want to track:

A) **Movies only**

B) **Books only**

C) **Movies AND Books**

I recommend **Movies only** because it simplifies the data.

2️⃣ Do you want the UI to look more like:

- **Netflix style**
- **Library style**
- **Simple card layout**

Once you answer those, I can also help you:

✅ Design the **entire UI layout**
✅ Write the **starter project files**
✅ Help you **deploy in 3 minutes**
✅ Plan **Week 8 coding so you finish fast**.

I want to do Movies, and I want simple mixed with a library style.

Perfect — **Movies only + simple library style** is an excellent choice. It keeps the **data structure simple**, the **UI clean**, and still allows you to implement **all 7 features for the Complete Tier**.

Let's lock in the **final project plan** so everything you submit this week aligns with the rubric and prepares you for Week 8.

Final Project Overview

Project Name

StoryVault: Movie Tracker

Project Description (Canvas + README)

StoryVault is a web application that allows users to browse a collection of movies and keep track of what they have watched. Users can save movies to favorites, mark them as watched, rate them, and write short reviews. The app also allows users to filter movies by genre or viewing status to better organize their personal movie library.

This fits the **2–3 sentence requirement** perfectly.

Planned Features (Complete Tier)

These will be your **7 features**.

Core Features

1️⃣ Browse Movie Collection

Users can view a collection of movies displayed as cards.

2️⃣ Save Favorites

Users can add movies to a favorites list.

3️⃣ Mark as Watched

Users can mark movies as watched.

4️⃣ Rating System

Users can rate movies from **1–5 stars**.

5️⃣ Write Reviews

Users can leave a short review for each movie.

Advanced Features

6️⃣ Filter by Genre

Users can filter movies by genre (Action, Drama, Comedy, etc.).

7️⃣ Filter by Status

Users can filter movies by:

- Watched
- Not Watched
- Favorites

UI Style (Simple Library Style)

Think of it like a **digital movie shelf**.

Layout idea:

```
---------------------------------
StoryVault Movie Tracker
Your personal movie library
---------------------------------

[Filter by Genre]   [Filter by Status]

---------------------------------
| Movie Card | Movie Card | Movie Card |
| Poster     | Poster     | Poster     |
| Title      | Title      | Title      |
| Genre      | Genre      | Genre      |
| ⭐ Rate    | ⭐ Rate    | ⭐ Rate    |
| ❤️ Fav    | ❤️ Fav    | ❤️ Fav    |
| ✓ Watched | ✓ Watched | ✓ Watched |
---------------------------------
```

Very clean and easy to build.

Week 7 Landing Page (What You Deploy)

Remember: the rubric requires **a custom landing page**.

Here is a good starter page.

index.html

```html
<!DOCTYPE html>
<html>
<head>
<title>StoryVault Movie Tracker</title>
<link rel="stylesheet" href="style.css">
</head>

<body>

<h1>StoryVault</h1>

<h2>Your Personal Movie Library</h2>

<p>
Browse movies, save your favorites, mark what you've watched,
and keep track of your personal movie collection.
</p>

</body>
</html>
```

What is this?

---

style.css

```css
body {
  font-family: Arial, sans-serif;
  background-color: #f4f6f8;
  text-align: center;
  padding-top: 100px;
}

h1 {
  font-size: 48px;
  color: #2c3e50;
}

h2 {
  color: #34495e;
}
```

```
p {
  font-size: 18px;
  max-width: 600px;
  margin: auto;
}
```

This satisfies the **Deployed App requirement**.

GitHub Repository Structure

Your repo should look like this:

```
storyvault-movie-tracker
│
├── index.html
├── style.css
├── script.js
│
├── data
│   └── movies.js
│
├── assets
│
├── README.md
└── .gitignore
```

This structure will impress the instructor because it is **organized**.

.gitignore File

Your repo needs one to satisfy the rubric.

Example:

```
node_modules
.DS_Store
.env
```

README (You Will Submit This)

Here is a polished version.

```
# StoryVault Movie Tracker

## Project Description
StoryVault is a web application that helps users track movies they want to watch

## Planned Features

1. Browse a collection of movies
2. Save movies to favorites
3. Mark movies as watched
4. Rate movies using a 1–5 star system
5. Write short reviews
6. Filter movies by genre
7. Filter movies by watch status

## Tech Stack

HTML
CSS
JavaScript
localStorage for saving user data
GitHub Pages for deployment

## Author
Your Name
```

This will **guarantee the README points**.

What You Submit on Canvas

Make sure your submission includes:

1️⃣ Deployed URL

Your live site from **GitHub Pages**

Example:

```
https://yourusername.github.io/storyvault-movie-tracker
```

2️⃣ GitHub Repository URL

From **GitHub**

3️⃣ Project Description

(Use the one we wrote)

4️⃣ Planned Features

(List the 7 features)

5️⃣ Screenshot

Take a screenshot of the **deployed landing page**.

6️⃣ AI Transcript

Export this conversation from **ChatGPT**.

Why This Project Will Score High

This project:

- ✔ Meets **Complete Tier feature count**
- ✔ Uses **localStorage (important for grading)**
- ✔ Has **clear UI structure**
- ✔ Is **easy to expand in Week 8**
- ✔ Has a **clean GitHub structure**

Next Step (We Should Do This Next)

Now let's **actually build your Week 7 deliverables**.

Next we should:

1️⃣ Create your GitHub repository

2️⃣ Create the starter project files

3️⃣ Deploy using GitHub Pages

4️⃣ Take the screenshot

I can also give you a **better landing page that looks 10x more impressive** but is still very easy to code (it will make your professor immediately see effort).

If you want, I can also show you:

The exact movie dataset we should use for Week 8 (so the browsing feature becomes extremely easy).

Do you like this personality?
